Summary

How to use our EasySave software ?

When you get to the software there are several options available to you

0. Exit EasySave

To quit the application just click on the cross in the top right corner.

1. Create a backup environment

To create a backup environment click on the button "add a backup environment".
Then enter the name.
Example: "test"

Then enter the paths of the source : ***Example: "C:\Users\EasySave\Desktop\DirectorySource"***

and destination files : ***Example: "C:\Users\EasySave\Desktop\DirectoryDestination"***

Once the backup environment is created you will be redirected to the home page.

2. Delete a backup environment

To delete the environment simply choose an environment from the list on the left and click on the

"delete environment" button.

3. Run a backup

To run a backup you have to select the environment from the drop-down list on the left and click on the button to "run a backup". So, choose your environment, once the environment is chosen, 2 options are available:

- Make a full backup

- Make a differential backup

Once a backup is done, a folder has been created with the date and time.

4. Restore a backup

If you choose option "restore backup" you will see the list of environments, you will have to choose an environment, and the type of backup you want to restore.

5. Run multiple backups

When you choose the option to run several backups at the same time you will get to a menu that will show you all the available environments. You click on an environment and select which type of backup you want to run and so on. To finish you click on the button "Run multiple backups".

6. Change of language

You can change language at any time and click on the "France" button to have the software in French or click on the "English" button to have the software in English.

7. BusinessSoftware

If you don't want to make a backup while a software is running and in the background you have to enter the name of the software in the business software part.

8. Files to encrypt

If you want to encrypt some file extensions you have to go to the "File to encrypt" part and enter the name of the extensions, example: ".docx or docx".
